Here's a simple Python code example for a case study portfolio:
Case Study Portfolio Example

```python
class Project:
    def __init__(self, name, description, technologies):
        self.name = name
        self.description = description
        self.technologies = technologies

    def display_project(self):
        print(f"Project Name: {self.name}")
        print(f"Description: {self.description}")
        print(f"Technologies: {self.technologies}")

# Create projects
project1 = Project("Data Analysis", "Analyzing customer data", "Python, Pandas, NumPy")
project2 = Project("Web Development", "Building a website", "Python, Flask, HTML/CSS")

# Display projects
project1.display_project()
print()
project2.display_project()
```

This code defines a `Project` class with attributes for project name, description, and technologies used.
You can add more projects and display them as needed.
